MovieLens Recommender System

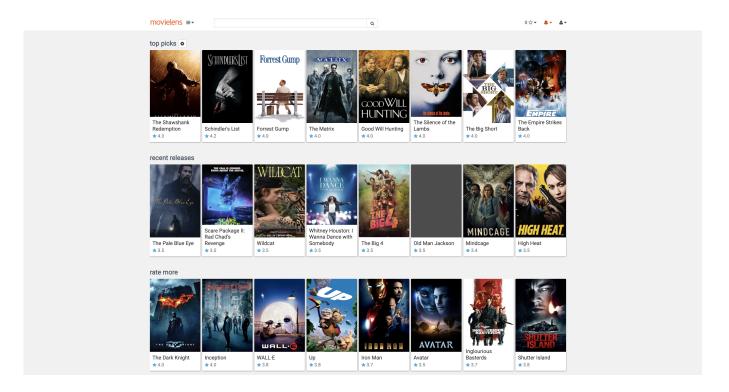

Student name: Yesim Cebeci

· Student pace: self paced

• Scheduled project review date/time: 01/04/2022

Instructor name: Morgan Jones

Overview

In this project, I chose the MovieLens dataset and managed to create a movie recommendation system that somehow simulates some of the most successful recommendation engine products, such as Spotify, YouTube, and Netflix.

This notebook is going to explain how I worked throughout the entire life cycle of this project, and provide my solutions to some technical issues.

For the recommender system I will use Content-based, Collaborative and Model Based.Recommender systems are built on MovieLens dataset with 100,000 movie ratings. These Recommender systems were built using Pandas operations and by fitting Machine Learning models to suggest movies for the users based on similar users and for queries specific to genre, user, movie, rating.

Business Understanding

MovieLens wants to improve it's movie recommendation system that is located on users' homepages.

The goal is to use users movie ratings and recommend other movies. This may save the user time when deciding which movie they would like to watch

Data Understanding

https://grouplens.org/datasets/movielens/latest/

This dataset (ml-latest-small) describes 5-star rating and free-text tagging activity from MovieLens, a movie recommendation service. It contains 100836 ratings and 943 users informations across 9742 movies.

Users were selected at random for inclusion. All selected users had rated at least 20 movies.

The data are contained in the files u.user, movies.csv and ratings.csv.

• movies.csv: Movie information is contained in the file movies.csv. Each line of this file after the header row represents one movie, and has the following format:

movield: Unique id for each movie

title: Name of movies followed by their year of release

genres: categories that a movie might fall into separated by |

• ratings.csv: A table that records all the users' rating behaviors, covering their rates and the time stamp when they posted the rates.

userId: Unique id for each user

movield: Unique id for each movie

rating: Rating given by userId for movield. Ratings are made on a 5-star scale with 0.5 increments.

timestamp: Time when rating was given

• u.user: A table that records each user's unique ID, age, sex, occupation and zip code.

Importing Libraries

```
# importing necessary libraries
import pandas as pd
import numpy as np
import matplotlib.pyplot as plt
import seaborn as sns
sns.set_style('whitegrid')
import warnings
warnings.filterwarnings('ignore')
```

Loading Dataset

```
from google.colab import drive
drive.mount('/content/drive')
```

Drive already mounted at /content/drive; to attempt to forcibly remount, call drive.mount("/content/drive", force_remount=Tru

```
path = "/content/drive/MyDrive/Project/ml-latest-small/movies.csv"
movie_df = pd.read_csv(path)
movie df.head()
```

genres	title	movieId	
AdventurelAnimationlChildrenlComedylFantasy	Toy Story (1995)	1	0
AdventurelChildrenlFantasy	Jumanji (1995)	2	1
ComedylRomance	Grumpier Old Men (1995)	3	2
ComedylDramalRomance	Waiting to Exhale (1995)	4	3
Comedy	Father of the Bride Part II (1995)	5	4

```
movie_df.info()
```

```

Some observation from dataset:

- Genres column has several genres , we need seperate them to do meaningful analysis
- users_df has zip_code columns we dont use this feature for the future analysis. it can be dropped.

Exploratory Data Analysis and Data Cleaning

```
# Merging ratings and movies data
merged_movies = pd.merge(movie_df, rating_df, on='movieId', how='inner')
merged_movies
```

```
